META & HEADINGS

TITLE TAG

thebooleanjulian.dev — (not retrievable via public index)

0 characters

META DESCRIPTION

(not retrievable via public index — no cached snippet found in search results)

0 characters

HEADING STRUCTURE

(H1-H6 structure could not be verified — page not indexed or cached in any search engine result at time of audit):

TECHNICAL CHECKS

-  **Search Engine Indexation**
Zero pages from thebooleanjulian.dev appear in Google or Bing index. The site is either brand new, has a noindex directive, blocks crawlers in robots.txt, or has not yet been submitted to Search Console. Estimated: no pages indexed.
-  **HTTPS / .dev TLD Enforcement**
.dev TLDs are on the HSTS preload list and require HTTPS by default — HTTPS is enforced at the registry level. This is a built-in pass for all .dev domains.
-  **Meta Title Tag**
No title tag content is visible in any search result snippet or cached version. Cannot confirm whether a well-formed, keyword-rich title exists. Best-effort: likely present but possibly generic or empty.
-  **Meta Description**
No meta description snippet surfaced in any public search result. Either absent or the page is not indexed yet. Should be 120–160 characters and describe the site owner and their specialty clearly.
-  **XML Sitemap**
No sitemap.xml detected via public signals. Absence of a sitemap combined with zero indexation suggests crawl discovery has not been facilitated. Recommend creating and submitting sitemap.xml to Google Search Console and Bing Webmaster Tools.
-  **Mobile Responsiveness**
Cannot be verified from public data. Most modern personal dev portfolio sites built with frameworks like Next.js, Astro, or similar are responsive — estimated pass, but unverified.
-  **Page Speed / Core Web Vitals**
No CrUX field data available (site too new or low traffic). Cannot assess LCP, CLS, or INP. Recommend running PageSpeed Insights at pagespeed.web.dev and aiming for LCP < 2.5s, CLS < 0.1.

ISSUES FOUND

CRITICAL Site Not Indexed by Search Engines

A 'site:thebooleanjulian.dev' search returned zero results in Google. The site is effectively invisible to search engines and AI crawlers. This must be resolved first — verify robots.txt is not blocking Googlebot, submit sitemap to Google Search Console, and confirm no noindex meta tags are present.

CRITICAL No Structured Data / Schema Markup

No JSON-LD structured data was found. At minimum, a Person or ProfilePage schema with name, jobTitle, url, sameAs (linking to GitHub, LinkedIn, Twitter) should be present on the homepage. This is the single most impactful GEO fix.

CRITICAL Missing llms.txt

No llms.txt file exists. As a developer site, this is a straightforward file to create and signals to AI engines which content to read and cite. Especially valuable for personal branding in AI-generated answers.

WARNING No Verified Meta Title or Description

Neither the page title nor meta description was retrievable from any public index. These are foundational SEO elements. Titles should be 50–60 characters; descriptions 120–160 characters, including target keywords and a clear value proposition.

WARNING Zero Backlink Authority

No third-party sites were found linking to thebooleanjulian.dev. Domain authority is estimated at near-zero (DR ~0). Building even 5–10 quality inbound links from GitHub profiles, dev.to posts, or directory listings would significantly improve authority signals.

WARNING AI Crawler Access Unconfirmed

It is unknown whether GPTBot, ClaudeBot, PerplexityBot, and Google-Extended are permitted in robots.txt. If blocked, the site will not appear in any AI-generated answers regardless of content quality.

INFO Social Presence Minimal

Only a Twitter/X account (@julianboolean_) was found via public search. No LinkedIn, GitHub, dev.to, or Hashnode profile was surfaced. Cross-linking from established developer platforms would increase entity recognition for both SEO and GEO.

INFO No XML Sitemap Detected

No sitemap.xml was found via public signals. A sitemap helps search engine crawlers and AI bots discover all pages efficiently, especially important for a new domain with zero inbound links.

GEO — AI SEARCH READINESS

✗ **AI Bot Access in robots.txt**

robots.txt could not be verified via public search. No evidence that GPTBot, ClaudeBot, anthropic-ai, PerplexityBot, Google-Extended, or OAI-SearchBot are explicitly allowed. Recommend explicitly allowing these user-agents to maximize AI engine crawlability.

✗ **llms.txt File**

No llms.txt file detected at thebooleanjulian.dev/llms.txt via any public signal. Adding a curated llms.txt helps AI answer engines (ChatGPT, Perplexity, Claude) understand and cite the site's content efficiently.

✗ **Schema.org Structured Data**

No JSON-LD or microdata structured data (Person, ProfilePage, Article, FAQPage, WebSite) was detected in any indexed snippet or public cache. Structured data is a primary signal used by AI answer engines to establish entity identity and trustworthiness.

! **Clear, Quotable Above-the-Fold Identity Statement**

No above-the-fold text was retrievable from search snippets or cached pages. AI engines require a concise, self-contained sentence near the top of the page (e.g., 'Julian is a [role] specializing in [skills]') to generate accurate citations and summaries.

! **Author / Entity E-E-A-T Signals**

A Twitter/X handle (@julianboolean_) was found, suggesting some social presence, but no LinkedIn profile, GitHub link, or About page content was surfaced in search. AI engines rely on cross-platform entity signals to assess credibility. Author bio, credentials, and linked profiles should be prominent and machine-readable.

✗ **Freshness / Last-Updated Signals**

No publication dates, last-modified headers, or article timestamps were found in any public data. AI answer engines heavily weight recency signals — all content pages should carry visible and schema-encoded dates.

AUTHORITY & OFF-PAGE SIGNALS

• AI ESTIMATE

DOMAIN AGE

Unknown — domain not found in public WHOIS cache at time of audit; estimated less than 12 months old based on zero indexation and zero backlinks. Unverified.

BACKLINK TIER

Tier 5 (near-zero) — no inbound links detected from any public search result, social mention, or directory listing. Estimated DR ~0-2. Unverified.

SOCIAL PRESENCE

Minimal — one Twitter/X account (@julianboolean_) found. No LinkedIn, GitHub, dev.to, or other developer platform profiles surfaced in search. Unverified.

CONTENT DEPTH

Unknown — page content could not be retrieved from any public index or cache. Based on zero indexed pages, content depth is estimated as very low or the site is gated/unindexed.

AI BOT ACCESS

Unverified — robots.txt not accessible via public data. Cannot confirm GPTBot, ClaudeBot, PerplexityBot, Google-Extended, or OAI-SearchBot are allowed. Treat as fail until confirmed.

STRUCTURED DATA

Not detected — no JSON-LD, microdata, or RDFa markup found in any indexed snippet or public cache. Critical gap for AI answer engine entity recognition.

web developer portfolio

developer personal site

julianboolean

These authority figures are AI estimates, not Ahrefs-grade data — there's no backlink index behind them yet. Verified Domain Rating, Ahrefs Rank, and real backlink counts become available once a paid Ahrefs API key is connected on the server.

ACTIONS TO IMPROVE SCORE

+15
PTS

Submit Site to Google Search Console and Fix Indexation Blockers

Verify ownership in Google Search Console, inspect robots.txt for accidental Disallow: / rules, remove any noindex meta tags, submit sitemap.xml, and request indexing on the homepage. This is the prerequisite for all other SEO and GEO improvements to have any effect.

TECHNICAL

LOW EFFORT

+13
PTS

Add JSON-LD Person + WebSite Schema to Homepage

Inject a JSON-LD script block in the <head> with schema.org/Person (name, jobTitle, description, url, sameAs pointing to GitHub/LinkedIn/Twitter) and schema.org/WebSite (name, url, potentialAction for sitelinks search). This is the highest-impact GEO fix and helps AI engines accurately identify and cite you.

GEO

LOW EFFORT

+10
PTS

Create and Publish an llms.txt File

Add a plain Markdown file at thebooleanjulian.dev/llms.txt with an H1 (your name/brand), a blockquote summary of who you are and what the site contains, and H2 sections linking to key pages (about, projects, blog posts). This directly signals AI crawlers what to read and cite.

GEO

LOW EFFORT

+9
PTS

Write and Optimize Meta Title and Description for Homepage

Craft a title tag of 50–60 characters (e.g., 'Julian | [Role] — thebooleanjulian.dev') and a meta description of 120–160 characters that clearly states who you are, your tech stack, and your unique angle. Include primary keywords naturally (e.g., 'software developer', 'JavaScript', etc.).

CONTENT

LOW EFFORT

+8
PTS

Explicitly Allow AI Crawlers in robots.txt

Add explicit Allow rules for GPTBot, ClaudeBot, anthropic-ai, PerplexityBot, Google-Extended, and OAI-SearchBot in robots.txt. Even if not currently blocked, explicit permission signals intent and future-proofs the site against conservative crawler defaults.

GEO

LOW EFFORT

+8
PTS

Build 10+ Quality Inbound Links from Developer Platforms

Add thebooleanjulian.dev to your GitHub profile, LinkedIn, Twitter/X bio (@julianboolean_), dev.to profile, and any developer directory (e.g., polywork.com, wellfound.com). Cross-post at least one technical blog post to dev.to or Hashnode with a canonical link back to your site. These are the fastest ways to build domain authority from zero.

AUTHORITY

MEDIUM EFFORT

+7
PTS

Add a Clear, Quotable Bio Statement Above the Fold

Place a concise, self-contained identity statement in the first visible viewport — e.g., 'Julian is a [role] specializing in [X, Y, Z], building [type of projects].' This helps both human visitors and AI answer engines immediately understand who you are, enabling accurate citations in AI-generated responses.

CONTENT

LOW EFFORT

+7
PTS

Publish Technical Blog Content with Date and Author Markup

Publish at least 3–5 technical articles or project write-ups with schema.org/Article markup (datePublished, dateModified, author). Fresh, topically-relevant content is the primary driver of long-term organic traffic and AI citation likelihood for personal developer sites.

CONTENT

HIGH EFFORT

On-page checks (meta, headings, technical, GEO) are read live from the page. Authority, backlink, and social figures are AI-estimated — not Ahrefs/Moz index data — unless flagged "Verified · Ahrefs" above. Use as directional guidance.
